SmartGate **Features**

DLP & PATTERN MATCHING

The SmartGate DLP engine will scan outgoing emails and quickly analyse them against a set of policies and assess if the email and/or any attachments pose a potential security risk to the organisation. Where a risk is identified, SmartGate will quarantine the email and allow user or administrator to release. The engine has a customisable policy set which allows organisations to increase or decrease the amount of DLP risk and control that is placed on organisations communication.

ANTI-SPAM

SmartGate Anti-Spam a variety of spam-detection techniques to successfully identify spam email content. It uses a wide variety of local and network tests to identify spam signatures, making it harder for spammers to identify any one aspect to which they can craft their messages to work around. SmartGate Anti-Spam requires very little configuration, and you do not need to continually update mail accounts and mail servers as you do in other anti-spam offerings.

THREAT PROTECTION

SmartGate Anti-Virus includes leading web threat analysis technology to effectively identify emails that contain malicious URLs and delivers zero-day protection against the latest threats. SmartGate utilises a widely used anti-virus engine employing a range of intelligent security features used to interrogate and identify malicious email messages in real-time to ensure your organisation is always safe.

ENCRYPTION

SmartGate Encryption automatically encrypts email at the mail gateway, adding an additional layer of protection to your information. SmartGate encryption is built to very high security standards, using the latest S/MIME encryption, as set by the GCSB and other security agencies. It provides robust protection to all corporations and organisations, to ensure emails cannot be intercepted, hacked, spoofed or read during transit over public networks. SmartGate encryption is a fully capable solution which is easy to implement, and requires no user interaction, making it simple, and effective.

MANAGEMENT & REPORTING

SmartGate provides exceptional visibility through comprehensive and detailed reports to provide you with information on your organisation's email activity. Use reports to assess the where email traffic is generated from, how many threats are being received, and analyse which policies are being triggered. Schedule reports to be distributed regularly to designated recipients by email, or publish reports into multiple formats for printing or distribution.

Protect your organisations communications from data loss, viruses, spam, and cyber threats easily from one platform.

SmartGate is a leading edge gateway content management filter, designed to provide high grade business and enterprise email protection against growing email threats by cyber criminals, competitors and email misuse by staff.

SmartGate provides robust and government grade email security system through a low cost, scalable model - that includes threat intelligence, encryption, virus, malware and data loss prevention tools that provide high grade protection. SmartGate was originally developed for Government departments and therefore has security robustness and functionality that is second to none.

SmartGate also meets all current accepted security standards and practices.

THE FACTS

88 % of companies experience data loss.

Only 53% of employees receive sensitive company data via email.

Only 32% of companies have DLP protection.
